How do you know how ‘bad’ the pollution problem is? Where are you going to be looking to compare? Be specific!

Good start, but be more descriptive! Why is this important? Also, avoid words of mediocrity (words such as good, bad, a lot, very, many). Try to make this paper sophisticated like you were giving it to an employer.

This section is off to a good start. Try to add a more sophisticated tone to your writing. Pretend you are writing to an employer.

You are using a lot of long, drawn out sentences. Break it up a bit, and it will help your writing flow a bit more. I have had to reread this Mission Objectives section a few times.

Is ozone really a pollutant? When you talk about your gases in general, refer to them by there names.

Are you going to talk about your environment sensors? But it made it sound like you need those environmental sensors in order to do your experiment. Make sure you connect these requirements directly to the mission statement.

What about analyzing the data post flight? What shall you find from this data?

What about the fact that this team shall be ready to fly on November 12th?

Correct amount? I don’t know if this is the word you are looking for. Your payload should just collect data in general.
